One Sentence

Python is the engine.
Power BI is the interface.

Logic in Python. Display in Power BI.

Five-Stage Pipeline

Four Integration Patterns

Pattern 1 — File

Python → CSV → Power BI

Simple. No infrastructure.

Pattern 3 — API

Python → REST API → Power BI

Fully decoupled. Multiple consumers.

Pattern 2 — Database

Python → DB → Power BI

Standard production setup.

Pattern 4 — Embedded

Calyra App → embedded Power BI

App controls context. PBI renders.

Three Principles

Python is logic.
Power BI is display.

Never cross the
boundary.

One model. All consumers read from it.

No divergent versions.

Same API → Power BI, LLM, any future tool.

Build once. Expose everywhere.

Interview

1. “Logic in Python. Display in Power BI.
2. “Power BI is a consumer, not the data model.
3. “One data model, many consumers.
4. “I version-control the transformation, not the dashboard.
